

Phenylalanine Ammonia-lyase (PAL) Activity Assay Kit

Note: It is necessary to predict 2-3 large difference samples before the formal determination.

Operation Equipment: Spectrophotometer/ Microplate Reader

Catalog Number: BC0215

Size: 100T/96S

Components:

Extract solution: Liquid 110 mL×1. Storage at 4°C.

Reagent I: Liquid 15 mL×1. Storage at 4°C.

Reagent II: Powder×2. Storage at 4°C. Dissolve with 1.5 mL of distilled water before use. The reagent should be prepared just before use, and could be stored at 4°C for 2 weeks.

Reagent III: Liquid 1 mL×1. Storage at 4°C.

Product Description:

Phenylalanine Ammonia-lyase (PAL) is widely found in various plants and a few microorganisms. It is a key enzyme in plants phenylpropanoid metabolism. PAL is closely related to some important secondary substances synthetic such as lignin, isoflavones phytoalexin, flavonoid pigments, and play an important role in normal growth and development in plants and against the bacteria resist.

L-phenylalanine can be decomposed into trans-cinnamic acid and ammonia by PAL, and trans-cinnamic acid has the maximum absorption value at 290 nm. In this kit, the activity of PAL can be calculated by measuring the absorbance increased rate.

Reagents and Equipment Required but Not Provided

Ultraviolet spectrophotometer/microplate reader, refrigerated centrifuge, transferpettor, ultra-micro quartz cuvette/96 well UV flat-bottom plate, mortar/ homogenizer, ice and distilled water.

Procedure:

I. Sample preparation:

Add 1 mL of Extract solution into 0.1 g of tissue, and fully homogenized on ice. Centrifuge at 10000 ×g for 10 minutes at 4°C to remove insoluble materials and take the supernatant on ice for testing.

II. Determination procedure:

1. Preheat the spectrophotometer/microplate reader for more than 30 minutes, adjust the wavelength to 290 nm, and set the counter to zero with distilled water.

2. Add the reagents as following to EP tube or 96 well UV flat-bottom plate

Reagent (μL)	Test tube (A1)	Contrast tube (A2)
Sample	5	-
Reagent I	145	150

Reagent II	40	40
Mix thoroughly, incubate at 30°C for 30 minutes.		
Reagent III	10	10

Mix thoroughly and place for 10 minutes. Detect the absorbance of the test tube (A1) and the contrast tube (A2) at 290 nm, calculate $\Delta A = A1 - A2$.

Note: Contrast tube just needs to test once or twice.

III. Calculation:

1. Micro glass cuvette

1) Protein concentration:

Unit definition: One unit of enzyme activity is defined as the amount of enzyme catalyzes the absorbance of 0.1 change at 290 nm in per milliliter reaction system per minute every milligram protein.

$$\text{PAL (U/mg prot)} = \Delta A \times V_{sv} \div V_s \div T \div 0.1 \div \text{Cpr} = 13.33 \times \Delta A \div \text{Cpr}$$

2) Sample weight

Unit definition: One unit of enzyme activity is defined as the amount of enzyme catalyzes the absorbance of 0.1 change at 290 nm in per milliliter reaction system per minute every gram tissue.

$$\text{PAL (U/g weight)} = \Delta A \times V_{sv} \div V_s \div T \div 0.1 \div W = 13.33 \times \Delta A \div W$$

2. 96 well UV flat-bottom plate

1) Protein concentration:

Unit definition: One unit of enzyme activity is defined as the amount of enzyme catalyzes the absorbance of 0.05 change at 290 nm in per milliliter reaction system per minute every milligram protein.

$$\text{PAL (U/mg prot)} = \Delta A \times V_{sv} \div V_s \div T \div 0.05 \div \text{Cpr} = 26.67 \times \Delta A \div \text{Cpr}$$

2) Sample weight:

Unit definition: One unit of enzyme activity is defined as the amount of enzyme catalyzes the absorbance of 0.05 change at 290 nm in per milliliter reaction system per minute every gram tissue.

$$\text{PAL (U/g weight)} = \Delta A \times V_{sv} \div V_s \div T \div 0.05 \div W = 26.67 \times \Delta A \div W$$

Cpr: Sample concentration, mg/mL;

W: Tissue weight, g;

Vs: Sample volume, 5 μL =0.005 mL;

Vrv: Total reaction volume, 0.2 mL;

Vsv: Extraction volume, 1 mL;

T: Reaction time, 30 minutes.
